UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.18/23/2018 4:52:25 PM
From File	HH_Pepco_OpenLot_Input.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Arsenic

General Statistics

Total Number of Observations	2	Number of Distinct Observations	2
		Number of Missing Observations	1
Minimum	1.8	Mean	2.2
Maximum	2.6	Median	2.2

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Arsenic was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Benzo(a)anthracene

General Statistics

Total Number of Observations	4	Number of Distinct Observations	4
		Number of Missing Observations	0
Minimum	0.077	Mean	0.137
Maximum	0.19	Median	0.14
SD	0.0491	Std. Error of Mean	0.0245
Coefficient of Variation	0.359	Skewness	-0.307

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.985	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.748	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.182	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.375	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	0.195	95% Adjusted-CLT UCL (Chen-1995)	0.173
		95% Modified-t UCL (Johnson-1978)	0.194

Gamma GOF Test

A-D Test Statistic	0.242	**Anderson-Darling Gamma GOF Test**
5% A-D Critical Value	0.657	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.226	**Kolmogorov-Smirnov Gamma GOF Test**
5% K-S Critical Value	0.395	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics

k hat (MLE)	9.291	k star (bias corrected MLE)	2.489
Theta hat (MLE)	0.0147	Theta star (bias corrected MLE)	0.0549
nu hat (MLE)	74.33	nu star (bias corrected)	19.92
MLE Mean (bias corrected)	0.137	MLE Sd (bias corrected)	0.0867
		Approximate Chi Square Value (0.05)	10.79
Adjusted Level of Significance	N/A	Adjusted Chi Square Value	N/A

Assuming Gamma Distribution

95% Approximate Gamma UCL (use when n>=50))	0.252	95% Adjusted Gamma UCL (use when n<50)	N/A

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.957	**Shapiro Wilk Lognormal GOF Test**
5% Shapiro Wilk Critical Value	0.748	Data appear Lognormal at 5% Significance Level
Lilliefors Test Statistic	0.204	**Lilliefors Lognormal GOF Test**
5% Lilliefors Critical Value	0.375	Data appear Lognormal at 5% Significance Level

Data appear Lognormal at 5% Significance Level

Lognormal Statistics

Minimum of Logged Data	-2.564	Mean of logged Data	-2.044
Maximum of Logged Data	-1.661	SD of logged Data	0.395

Assuming Lognormal Distribution

95% H-UCL	0.287	90% Chebyshev (MVUE) UCL	0.217
95% Chebyshev (MVUE) UCL	0.254	97.5% Chebyshev (MVUE) UCL	0.304
99% Chebyshev (MVUE) UCL	0.403		

Nonparametric Distribution Free UCL Statistics

Data appear to follow a Discernible Distribution at 5% Significance Level

Nonparametric Distribution Free UCLs

95% CLT UCL	0.177	95% Jackknife UCL	0.195
95% Standard Bootstrap UCL	N/A	95% Bootstrap-t UCL	N/A
95% Hall's Bootstrap UCL	N/A	95% Percentile Bootstrap UCL	N/A
95% BCA Bootstrap UCL	N/A		
90% Chebyshev(Mean, Sd) UCL	0.21	95% Chebyshev(Mean, Sd) UCL	0.244
97.5% Chebyshev(Mean, Sd) UCL	0.29	99% Chebyshev(Mean, Sd) UCL	0.381

Suggested UCL to Use

95% Student's-t UCL 0.195

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Benzo(a)pyrene

General Statistics

Total Number of Observations	4	Number of Distinct Observations	3
		Number of Missing Observations	0
Minimum	0.099	Mean	0.155
Maximum	0.18	Median	0.17
SD	0.0383	Std. Error of Mean	0.0192
Coefficient of Variation	0.248	Skewness	-1.667

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Adjusted Level of Significance	N/A	Adjusted Chi Square Value	N/A

Assuming Gamma Distribution

95% Approximate Gamma UCL (use when n>=50))	0.269	95% Adjusted Gamma UCL (use when n<50)	N/A

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.903	**Shapiro Wilk Lognormal GOF Test**
5% Shapiro Wilk Critical Value	0.748	Data appear Lognormal at 5% Significance Level
Lilliefors Test Statistic	0.266	**Lilliefors Lognormal GOF Test**
5% Lilliefors Critical Value	0.375	Data appear Lognormal at 5% Significance Level

Data appear Lognormal at 5% Significance Level

Lognormal Statistics

Minimum of Logged Data	-2.386	Mean of logged Data	-1.924
Maximum of Logged Data	-1.609	SD of logged Data	0.363

Assuming Lognormal Distribution

95% H-UCL	0.293	90% Chebyshev (MVUE) UCL	0.236
95% Chebyshev (MVUE) UCL	0.273	97.5% Chebyshev (MVUE) UCL	0.325
99% Chebyshev (MVUE) UCL	0.427		

Nonparametric Distribution Free UCL Statistics

Data appear to follow a Discernible Distribution at 5% Significance Level

Nonparametric Distribution Free UCLs

95% CLT UCL	0.195	95% Jackknife UCL	0.213
95% Standard Bootstrap UCL	N/A	95% Bootstrap-t UCL	N/A
95% Hall's Bootstrap UCL	N/A	95% Percentile Bootstrap UCL	N/A
95% BCA Bootstrap UCL	N/A		
90% Chebyshev(Mean, Sd) UCL	0.23	95% Chebyshev(Mean, Sd) UCL	0.264
97.5% Chebyshev(Mean, Sd) UCL	0.313	99% Chebyshev(Mean, Sd) UCL	0.407

Suggested UCL to Use

95% Student's-t UCL 0.213

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Cobalt

General Statistics

Total Number of Observations	2	Number of Distinct Observations	2
		Number of Missing Observations	1
Minimum	92	Mean	111
Maximum	130	Median	111

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Cobalt was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Dibenzo(a,h)anthracene

General Statistics

Total Number of Observations	4	Number of Distinct Observations	3
		Number of Missing Observations	0
Minimum	0.023	Mean	0.0323
Maximum	0.046	Median	0.03
SD	0.00974	Std. Error of Mean	0.00487
Coefficient of Variation	0.302	Skewness	1.287

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Mean (detects)	0.0557		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Number of Distinct Detects	0	Number of Distinct Non-Detects	1

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Thallium was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Vanadium

General Statistics

Assuming Gamma Distribution

95% Approximate Gamma UCL (use when n>=50))	24.37	95% Adjusted Gamma UCL (use when n<50)	24.61

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.954	**Shapiro Wilk Lognormal GOF Test**
5% Shapiro Wilk Critical Value	0.944	Data appear Lognormal at 5% Significance Level
Lilliefors Test Statistic	0.127	**Lilliefors Lognormal GOF Test**
5% Lilliefors Critical Value	0.132	Data appear Lognormal at 5% Significance Level

Data appear Lognormal at 5% Significance Level

Lognormal Statistics

Minimum of Logged Data	0.693	Mean of logged Data	2.283
Maximum of Logged Data	5.247	SD of logged Data	1.028

Assuming Lognormal Distribution

95% H-UCL	24.23	90% Chebyshev (MVUE) UCL	25.29
95% Chebyshev (MVUE) UCL	29.35	97.5% Chebyshev (MVUE) UCL	34.98
99% Chebyshev (MVUE) UCL	46.03		

Nonparametric Distribution Free UCL Statistics

Data appear to follow a Discernible Distribution at 5% Significance Level

Nonparametric Distribution Free UCLs

95% CLT UCL	25.94	95% Jackknife UCL	26.11
95% Standard Bootstrap UCL	25.79	95% Bootstrap-t UCL	34.18
95% Hall's Bootstrap UCL	55.65	95% Percentile Bootstrap UCL	26.12
95% BCA Bootstrap UCL	30.41		
90% Chebyshev(Mean, Sd) UCL	32.23	95% Chebyshev(Mean, Sd) UCL	38.53
97.5% Chebyshev(Mean, Sd) UCL	47.28	99% Chebyshev(Mean, Sd) UCL	64.46

Suggested UCL to Use

95% H-UCL 24.23

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Benzo(a)anthracene

General Statistics

Total Number of Observations	18	Number of Distinct Observations	18
		Number of Missing Observations	41
Minimum	0.02	Mean	0.436

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Arsenic

General Statistics

Total Number of Observations	3	Number of Distinct Observations	3
		Number of Missing Observations	55
Minimum	7.1	Mean	11.37
Maximum	14	Median	13
SD	3.729	Std. Error of Mean	2.153
Coefficient of Variation	0.328	Skewness	-1.593

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.856	**Shapiro Wilk GOF Test**

nu hat (MLE)	36.44	nu star (bias corrected)	31.7
Mean (detects)	0.861		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.816
Maximum	2.5	Median	0.34

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.492

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	32.05	nu star (bias corrected)	30.98
Mean (detects)	1.172		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0021	Mean	1.144
Maximum	14	Median	0.3

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.37

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% KM Bootstrap t UCL	0.251	d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.273

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Bootstrap t UCL	0.408	d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.437

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
Iowever, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Manganese

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
		Number of Missing Observations	19
Minimum	42	Mean	117.9
Maximum	220	Median	110
SD	57.72	Std. Error of Mean	20.41
Coefficient of Variation	0.49	Skewness	0.5

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Theta hat (MLE)	0.0564	Theta star (bias corrected MLE)	0.0635
nu hat (MLE)	35.41	nu star (bias corrected)	31.43
Mean (detects)	0.0499		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0016	Mean	0.037
Maximum	0.41	Median	0.0165
SD	0.0729	CV	1.969
k hat (MLE)	0.911	k star (bias corrected MLE)	0.842

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.0792

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nickel

General Statistics

Total Number of Observations	3	Number of Distinct Observations	2
		Number of Missing Observations	1
Minimum	19	Mean	22.67
Maximum	30	Median	19
SD	6.351	Std. Error of Mean	3.667
Coefficient of Variation	0.28	Skewness	1.732

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

TCDD TEQ HH

General Statistics

Total Number of Observations	2	Number of Distinct Observations	2
		Number of Missing Observations	2
Minimum	5.5500E-6	Mean	9.6250E-6
Maximum	1.3700E-5	Median	9.6250E-6

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable TCDD TEQ HH was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Thallium

General Statistics

Total Number of Observations	3	Number of Distinct Observations	3
		Number of Missing Observations	1
Number of Detects	0	Number of Non-Detects	3
Number of Distinct Detects	0	Number of Distinct Non-Detects	3

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium was not processed!

Vanadium

General Statistics

Total Number of Observations	3	Number of Distinct Observations	3

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
ested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV

The data set for variable Thallium was not processed!

Vanadium

General Statistics

Total Number of Observations	4	Number of Distinct Observations	4
		Number of Missing Observations	9
Minimum	3.4	Mean	14.6
Maximum	23	Median	16
SD	9.127	Std. Error of Mean	4.564
Coefficient of Variation	0.625	Skewness	-0.523

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.918	Shapiro Wilk GOF Test

Suggested UCL to Use

95% Student's-t UCL	25.34

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Arsenic

General Statistics

Total Number of Observations	1	Number of Distinct Observations	1
		Number of Missing Observations	14
Minimum	1.7	Mean	1.7
Maximum	1.7	Median	1.7

Warning: This data set only has 1 observations!

Data set is too small to compute reliable and meaningful statistics and estimates!

The data set for variable Arsenic was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!

If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0033	Mean	0.327

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.233

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.391

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Manganese

General Statistics

Total Number of Observations	1	Number of Distinct Observations	1
		Number of Missing Observations	14
Minimum	260	Mean	260
Maximum	260	Median	260

Warning: This data set only has 1 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable Manganese was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0029	Mean	0.0201

95% Student's-t UCL	2.613

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.0333

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Diesel Range Organics (C10-C20)

General Statistics

Total Number of Observations	11	Number of Distinct Observations	5
		Number of Missing Observations	7
Number of Detects	1	Number of Non-Detects	10
Number of Distinct Detects	1	Number of Distinct Non-Detects	4

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Diesel Range Organics (C10-C20) was not processed!

General Statistics

Total Number of Observations	4	Number of Distinct Observations	4
		Number of Missing Observations	12
Minimum	36	Mean	209
Maximum	370	Median	215
SD	137.1	Std. Error of Mean	68.54
Coefficient of Variation	0.656	Skewness	-0.258

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Suggested UCL to Use

95% Student's-t UCL	370.3

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Suggested UCL to Use

95% H-UCL	17.22

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0014	Mean	1.016

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% H-UCL 336.6

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Arsenic

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	140
Minimum	0.39	Mean	5.421
Maximum	14	Median	2.9
SD	5.161	Std. Error of Mean	1.72
Coefficient of Variation	0.952	Skewness	0.877

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0036	Mean	10.23
Maximum	530	Median	0.24

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0073	Mean	10.3

General Statistics

Total Number of Observations	9	Number of Distinct Observations	8
		Number of Missing Observations	140
Minimum	2.9	Mean	6.111
Maximum	17	Median	4.4
SD	4.516	Std. Error of Mean	1.505
Coefficient of Variation	0.739	Skewness	2.187

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1) 2093

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
-lowever, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Manganese

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	140
Minimum	24	Mean	142.2
Maximum	500	Median	110
SD	145.7	Std. Error of Mean	48.56
Coefficient of Variation	1.024	Skewness	2.208

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

KM H-UCL 0.724

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nickel

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	140
Minimum	2.5	Mean	10.79
Maximum	27	Median	9.8
SD	7.572	Std. Error of Mean	2.524
Coefficient of Variation	0.702	Skewness	1.212

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

nu hat (MLE)	63.91	nu star (bias corrected)	63.11
Mean (detects)	0.805		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	8.6000E-4	Mean	0.66

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL	23.07

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
Iowever, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
se of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

		Number of Missing Observations	33
Minimum	2.2	Mean	3.083
Maximum	4.2	Median	3
SD	0.76	Std. Error of Mean	0.31
Coefficient of Variation	0.247	Skewness	0.422

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.173

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean Detects	0.1	SD Detects	0.0295
Median Detects	0.1	CV Detects	0.294
Skewness Detects	0.0508	Kurtosis Detects	N/A
Mean of Logged Detects	-2.329	SD of Logged Detects	0.303

Warning: Data set has only 3 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

General Statistics

Total Number of Observations	7	Number of Distinct Observations	6
		Number of Missing Observations	18
Minimum	1.8	Mean	3.786
Maximum	4.7	Median	4
SD	1.051	Std. Error of Mean	0.397
Coefficient of Variation	0.278	Skewness	-1.266

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	1.561

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

TCDD TEQ HH

General Statistics

Total Number of Observations	2	Number of Distinct Observations	2
		Number of Missing Observations	21
Minimum	3.6200E-7	Mean	2.3660E-6
Maximum	4.3700E-6	Median	2.3660E-6

Warning: This data set only has 2 observations!
Data set is too small to compute reliable and meaningful statistics and estimates!
The data set for variable TCDD TEQ HH was not processed!

It is suggested to collect at least 8 to 10 observations before using these statistical methods!
If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.

Arsenic

General Statistics

Total Number of Observations	3	Number of Distinct Observations	3
		Number of Missing Observations	54
Minimum	0.81	Mean	3.403
Maximum	7.7	Median	1.7
SD	3.748	Std. Error of Mean	2.164
Coefficient of Variation	1.101	Skewness	1.623

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.845	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.767	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.342	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.425	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

Assuming Normal Distribution

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0033	Mean	2.2
Maximum	23	Median	0.77

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL	0.567

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma Statistics on Detected Data Only

k hat (MLE)	0.149	k star (bias corrected MLE)	0.151
Theta hat (MLE)	543.3	Theta star (bias corrected MLE)	537
nu hat (MLE)	37.34	nu star (bias corrected)	37.78
Mean (detects)	81.15		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Median Detects	0.128	CV Detects	0.471
Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-2.119	SD of Logged Detects	0.49

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.878

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Cobalt

General Statistics

Total Number of Observations	5	Number of Distinct Observations	5
		Number of Missing Observations	10
Minimum	2.6	Mean	5.52
Maximum	7.3	Median	6.8
SD	2.095	Std. Error of Mean	0.937
Coefficient of Variation	0.379	Skewness	-0.818

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Gamma Distributed at 5% Significance Level

Suggested UCL to Use

d KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.45

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Data do not follow a Discernible Distribution at 5% Significance Level

Suggested UCL to Use

95% KM (Chebyshev) UCL 0.215

Warning: Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
Iowever, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Vanadium

General Statistics

Total Number of Observations	5	Number of Distinct Observations	4
		Number of Missing Observations	10
Minimum	13	Mean	21.8
Maximum	29	Median	26
SD	7.259	Std. Error of Mean	3.247
Coefficient of Variation	0.333	Skewness	-0.517

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

nu hat (MLE)	5.917	nu star (bias corrected)	3.7
Mean (detects)	3.964		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	1.247
Maximum	15	Median	0.01

Confidence Coefficient	95%
Number of Bootstrap Operations	2000

RA17_GW_VOCs|Bromodichloromethane (salvage)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	1
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	1

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable RA17_GW_VOCs|Bromodichloromethane (salvage) was not processed!

RA17_GW_VOCs|Chloroform (salvage)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	1
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	1

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable RA17_GW_VOCs|Chloroform (salvage) was not processed!

RA17_GW_VOCs|Methyl tert-Butyl Ether (MTBE) (salvage)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	7
		Number of Missing Observations	0
Minimum	0.25	Mean	1.564
Maximum	4.9	Median	0.35
SD	1.888	Std. Error of Mean	0.668
Coefficient of Variation	1.208	Skewness	1.133

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.74	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.818	Data Not Normal at 5% Significance Level

Mean (detects)	4.09		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	2.163

Suggested UCL to Use

95% KM Bootstrap t UCL	N/A	a Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	9.463

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Confidence Coefficient	95%
ımber of Bootstrap Operations	2000

RA17_GW_VOCs|Bromodichloromethane

General Statistics

Total Number of Observations	7	Number of Distinct Observations	1
		Number of Missing Observations	20
Number of Detects	0	Number of Non-Detects	7
Number of Distinct Detects	0	Number of Distinct Non-Detects	1

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable RA17_GW_VOCs|Bromodichloromethane was not processed!

RA17_GW_VOCs|Chloroform

General Statistics

Total Number of Observations	7	Number of Distinct Observations	3
		Number of Missing Observations	20
Number of Detects	2	Number of Non-Detects	5
Number of Distinct Detects	2	Number of Distinct Non-Detects	1
Minimum Detect	0.32	Minimum Non-Detect	1
Maximum Detect	1.3	Maximum Non-Detect	1
Variance Detects	0.48	Percent Non-Detects	71.43%
Mean Detects	0.81	SD Detects	0.693
Median Detects	0.81	CV Detects	0.856
Skewness Detects	N/A	Kurtosis Detects	N/A
Mean of Logged Detects	-0.439	SD of Logged Detects	0.991

Warning: Data set has only 2 Detected Values.
This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Skewness Detects	2.182	Kurtosis Detects	4.821
Mean of Logged Detects	-0.254	SD of Logged Detects	1.151

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	6.132
Maximum	21	Median	2.702

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% H-UCL	0.7

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0129	Mean	0.147

Mean (detects)	1010		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
ROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-2
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Adjusted Gamma UCL	66.57

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

4,4'-DDE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	12
Minimum	2.96	Mean	36.33
Maximum	100.7	Median	23.9
SD	36.3	Std. Error of Mean	14.82
Coefficient of Variation	0.999	Skewness	1.319

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.188

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

KM H-UCL	0.434

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Skewness Detects	1.426	Kurtosis Detects	1.962
Mean of Logged Detects	-1.778	SD of Logged Detects	0.879

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.867	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.762	Detected Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.278	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.343	Detected Data appear Normal at 5% Significance Level

nu hat (MLE)	18.53	nu star (bias corrected)	8.746
Mean (detects)	0.227		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% Student's-t UCL 5.74

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

cis-NONACHLOR

General Statistics

Total Number of Observations	7	Number of Distinct Observations	7
		Number of Missing Observations	14
Minimum	1.29	Mean	4.134
Maximum	12.9	Median	2.48
SD	4.203	Std. Error of Mean	1.589
Coefficient of Variation	1.017	Skewness	1.94

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

95% Student's-t UCL 0.00269

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	3.5900E-4		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	0.354		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.201

Suggested UCL to Use

95% KM (t) UCL 0.00464

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	0.00435		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 5.4575E-6

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM Bootstrap t UCL	0.0611	ıa Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	0.0638

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	18
Number of Detects	4	Number of Non-Detects	5
Number of Distinct Detects	4	Number of Distinct Non-Detects	5
Minimum Detect	0.471	Minimum Non-Detect	0.0492
Maximum Detect	3.5	Maximum Non-Detect	0.05
Variance Detects	1.949	Percent Non-Detects	55.56%
Mean Detects	1.618	SD Detects	1.396
Median Detects	1.251	CV Detects	0.863
Skewness Detects	1.045	Kurtosis Detects	-0.2
Mean of Logged Detects	0.171	SD of Logged Detects	0.928

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

nu hat (MLE)	14.1	nu star (bias corrected)	4.858
Mean (detects)	1.618		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.725
Maximum	3.5	Median	0.01

Suggested UCL to Use

95% Adjusted Gamma UCL	33.13

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	1.001	Mean	21.61

Attachment F

Derivation of Volatilization Factors for Groundwater to Excavation Trench

Attachment F
Derivation of Volatilization Factors for Groundwater to Excavation Trench

The Virginia Department of Environmental Quality (VADEQ) has published an approach for predicting exposure of workers to volatile substances in trenches from standing groundwater in the trench (VADEQ, 2018, Appendix 2). The model is based on the assumption that the trench would only intercept groundwater for a few inches, as any deeper than that would require dewatering. The VADEQ model uses a simple box model to simulate the mixing of contaminants in air. The main equation is:

$\mathbf{C_{trench} = C_{GW} \times VF}$ Equation (1)

where:

C_{trench} = concentration of volatile substance in trench (µg/m^3)

C_{GW} = concentration of volatile substance in groundwater (µg/L)

VF = volatilization factor

The exposed groundwater model is very conservative, and in some cases yields unrealistically high vapor concentrations in a trench, as discussed in the uncertainty section of this attachment. However, the default model is conservatively used in this evaluation as a screening tool.

For standing groundwater in the floor of an excavation trench exposed to the atmosphere, the following equation is used to determine the volatilization factor:

$\mathbf{VF = (K_i \times A \times F \times 10^{-3} \times 10^{4} \times 3{,}600) \div (ACH \times V)}$ Equation (2)

where:

Ki = overall mass transfer coefficient of the volatile substance (cm/s)

A = area of trench (m^2)

F = fraction of floor through which contaminant can enter (dimensionless)

ACH = air changes per hour (hr^{-1})

V = volume of trench (m^3)

Per United States Environmental Protection Agency (USEPA) Region III, a value of 2 hr^{-1} is to be used for ACH in cases when the trench depth is greater than the trench width. Table F-1 presents the calculations based on the default model for exposed groundwater.

Uncertainty

The default VADEQ ACH of 2 hr^{-1} represents the restricted gas exchange between the trench and the ambient atmosphere in an 8-foot-long by 3-foot-wide by 8-foot-deep trench (i.e., its depth is greater than its width). When the trench width exceeds the trench depth, the gas exchange between the trench and the ambient atmosphere is assumed to be relatively unrestricted, and a value of 360 hr^{-1} is suggested by the USEPA. For an ambient wind speed of 1 meter per second (m/s), it is assumed that the in-trench air velocity is 0.1 m/s (10% of ambient), resulting in a more realistic ACH of 148 hr^{-1}. In that case, the air concentrations estimated by the default model are over 70 times greater than those predicted by a model based on a more realistic ACH.

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not Applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.

(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(3) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

		Exposure Point Total										(3)					(3)
	Exposure Medium Total											(3)					(3)
Soil Total												(3)					(3)
Total Receptor Risk/Hazard												(3)					(3)

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(3) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

Table H-1-4. RME
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Adult Angler (Mixed Fish Diet)
Reasonable Maximum Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Adult

							Cancer Risk Calculations						Noncancer Hazard Calculations				
	Exposure	Exposure	Exposure	Chemical of	EPC		Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
Medium	Medium	Point	Route	Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Risk	Value	Units	Value	Units	Quotient

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
EPD - Effective Predictive Domain.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-Tetrachloro-dibenzo-p-dioxin Toxicity Equivalence.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Fish consumption Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Fish consumption Risk/Hazard based on all COPCs except Total PCBs.

Fish Tissue Total - Upper Anacostia (Total PCBs)[3]												1.65E-05					2.24E+00
Fish Tissue Total - Upper Anacostia (PCB-TEQ)[4]												8.55E-06					6.63E-01
Receptor Totals																	
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment, surface water, and fish)												**1.72E-05**					**2.29E+00**
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment and surface water and PCB-TEQ for fish)												**9.25E-06**					**7.11E-01**

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
EPD - Effective Predictive Domain.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-Tetrachloro-dibenzo-p-dioxin Toxicity Equivalence.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Fish consumption Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Fish consumption Risk/Hazard based on all COPCs except Total PCBs.

Fish Tissue Total - Upper Anacostia (PCB-TEQ)[4]												7.18E-06					1.11E+00
Receptor Totals																	
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment, surface water, and fish)												**1.57E-05**					**4.02E+00**
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment and surface water and PCB-TEQ for fish)												**9.03E-06**					**1.36E+00**

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-7. RME
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Adult Angler (Mixed Fish Diet) - Regional Areas
Reasonable Maximum Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations						Noncancer Hazard Calculations				
							Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
					Value	Units	Value	Units	Value	Units	ADAF [(1)]	Risk	Value	Units	Value	Units	Quotient

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-8. RME
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Older Child/Teen Angler (Mixed Fish Diet) - Regional Areas
Reasonable Maximum Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Older Child/Teen

							Cancer Risk Calculations						Noncancer Hazard Calculations				
	Exposure	Exposure	Exposure	Chemical of	EPC		Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
Medium	Medium	Point	Route	Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Risk	Value	Units	Value	Units	Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
ND - Not Detected.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-9. RME
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Child Angler (Mixed Fish Diet) - Regional Areas
Reasonable Maximum Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Child

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations						Noncancer Hazard Calculations				
							Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
					Value	Units	Value	Units	Value	Units	ADAF (1)	Risk	Value	Units	Value	Units	Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
NA - Not Applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

Receptor Total								2.44E-06	2.12E+00			3.57E-08	3.67E-01

Notes:
EPC - Exposure Point Concentration.
NA - Not Applicable; no dose-response value.
ND - Not Detected.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
VOC - Volatile Organic Compound.

(1) The potential carcinogenic risk and noncarcinogenic hazard quotients are calculated per exposure area by multiplying the soil or air EPCs associated with each EA by the unit risks and hazard quotients calculated in the Tables G-1-1. RME and G-2a-1. RME based on a unit soil or air concentration.

Notes:
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.

(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(2) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(3) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Target Organ HI - Upper Potomac Fish

Organ	Chemical	Fish Tissue	Total
Bladder	Arsenic, organic	3.69E-03	4E-03
Developmental	PCB-TEQ, TCDD-TEQ, 4,4-DDE	9.07E+00	9E+00
Endocrine	Mirex	3.19E-04	3E-04
Eye	Total PCBs	1.44E+01	1E+01
Immune	Total PCBs	1.44E+01	1E+01
Liver	Pesticides	6.28E-01	6E-01
Nails	Total PCBs	1.44E+01	1E+01
Neurological	Methyl Mercury	3.31E-01	3E-01
Reproductive	PCB-TEQ, TCDD-TEQ	8.92E+00	9E+00
Skin	Arsenic	2.73E-02	3E-02
Vascular	Arsenic	2.73E-02	3E-02

Target Organ HI - Lower Potomac Fish

Organ	Chemical	Fish Tissue	Total
Bladder	Arsenic, organic	3.44E-02	3E-02
Developmental	PCB-TEQ, TCDD-TEQ, 4,4-DDE	1.16E+00	1E+00
Eye	Total PCBs	2.26E+00	2E+00
Immune	Total PCBs	2.26E+00	2E+00
Liver	Pesticides	1.63E-01	2E-01
Nails	Total PCBs	2.26E+00	2E+00
Neurological	Methyl Mercury	2.26E-01	2E-01
Reproductive	PCB-TEQ, TCDD-TEQ	1.14E+00	1E+00
Skin	Arsenic	2.55E-01	3E-01
Vascular	Arsenic	2.55E-01	3E-01

Target Organ HI - Lower Anacostia

Organ	Chemical	Fish Tissue	Total
Bladder	Arsenic, organic	2.27E-03	2E-03
Developmental	PCB-TEQ, TCDD-TEQ, 4,4-DDE	2.96E+00	3E+00
Endocrine	Mirex	3.63E-04	4E-04
Eye	Total PCBs	4.73E+00	5E+00
Immune	Total PCBs	4.73E+00	5E+00
Liver	Pesticides	4.22E-01	4E-01
Nails	Total PCBs	4.73E+00	5E+00
Neurological	Methyl Mercury	2.01E-01	2E-01
Reproductive	PCB-TEQ, TCDD-TEQ	2.92E+00	3E+00
Skin	Arsenic	1.68E-02	2E-02
Vascular	Arsenic	1.68E-02	2E-02

Target Organ HI - Non-Tidal Anacostia Fish

Organ	Chemical	Fish Tissue	Total
Bladder	Arsenic, organic	7.02E-04	7E-04
Developmental	PCB-TEQ, TCDD-TEQ, 4,4-DDE	2.08E-01	2E-01
Eye	Total PCBs	2.97E-01	3E-01
Hair	Thallium	7.93E-02	8E-02
Immune	Total PCBs	2.97E-01	3E-01
Liver	Pesticides	1.73E-01	2E-01
Nails	Total PCBs	2.97E-01	3E-01
Neurological	Methyl Mercury	6.14E-01	6E-01
Reproductive	PCB-TEQ, TCDD-TEQ	2.08E-01	2E-01
Skin	Arsenic	5.20E-03	5E-03
Thyroid	Cobalt	1.11E-02	1E-02
Vascular	Arsenic	5.20E-03	5E-03

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not Applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.

(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(3) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

Surface Soil Total												(3)					(3)
Total Receptor Risk/Hazard												(3)					(3)

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(3) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable/no dose-response value.
ND - Not Detected in this area.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Table H-1-4. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Adult Angler (Mixed Fish Diet)
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations						Noncancer Hazard Calculations				
							Intake/Exposure Concentration		CSF		ADAF (1)	Cancer Risk	Intake/Exposure Concentration		RfD		Hazard Quotient
					Value	Units	Value	Units	Value	Units			Value	Units	Value	Units	

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
EPD - Effective Predictive Domain.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-Tetrachloro-dibenzo-p-dioxin Toxicity Equivalence.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Fish consumption Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Fish consumption Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-5. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Older Child/Teen Angler (Mixed Fish Diet)
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Older Child/Teen

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations						Noncancer Hazard Calculations				
							Intake/Exposure Concentration		CSF		ADAF [(1)]	Cancer Risk	Intake/Exposure Concentration		RfD		Hazard Quotient
					Value	Units	Value	Units	Value	Units			Value	Units	Value	Units	

Notes:

ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
EPD - Effective Predictive Domain.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-Tetrachloro-dibenzo-p-dioxin Toxicity Equivalence.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Fish consumption Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Fish consumption Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-6. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Child Angler (Mixed Fish Diet)
Reasonable Maximum Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Child

Fish Tissue Total - Upper Anacostia (PCB-TEQ)[4]												1.80E-07					1.04E-01
Receptor Totals																	
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment, surface water, and fish)												**5.15E-07**					**3.96E-01**
Total Receptor Risk/Hazard - Upper Anacostia (includes Total PCBs for sediment and surface water and PCB-TEQ for fish)												**2.87E-07**					**1.42E-01**

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-7. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Adult Angler (Mixed Fish Diet) - Regional Areas
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Adult

							Cancer Risk Calculations						Noncancer Hazard Calculations				
	Exposure	Exposure	Exposure	Chemical of	EPC		Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
Medium	Medium	Point	Route	Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Risk	Value	Units	Value	Units	Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-8. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Older Child/Teen Angler (Mixed Fish Diet) - Regional Areas
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Older Child/Teen

							Cancer Risk Calculations						Noncancer Hazard Calculations				
	Exposure	Exposure	Exposure	Chemical of	EPC		Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
Medium	Medium	Point	Route	Potential Concern	Value	Units	Value	Units	Value	Units	ADAF [(1)]	Risk	Value	Units	Value	Units	Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
ND - Not Detected.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Table H-1-9. CTE
Calculation of Chemical Cancer Risks and Non-Cancer Hazards - Child Angler (Mixed Fish Diet) - Regional Areas
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Child

							Cancer Risk Calculations						Noncancer Hazard Calculations				
	Exposure	Exposure	Exposure	Chemical of	EPC		Intake/Exposure Concentration		CSF			Cancer	Intake/Exposure Concentration		RfD		Hazard
Medium	Medium	Point	Route	Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Risk	Value	Units	Value	Units	Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.
(2) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(3) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(4) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Age-Dependent Adjustment Factor (ADAF) is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. See Text for explanation.

Notes:
NA - Not Applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

	Exposure Medium Total							5.46E-12	1.55E-02			1.56E-11	1.21E-02
Groundwater								5.46E-12	1.55E-02			1.56E-11	1.21E-02
Receptor Total								7.69E-09	4.32E-01			7.08E-08	8.52E-01

Notes:
EPC - Exposure Point Concentration.
NA - Not Applicable; no dose-response value.
ND - Not Detected.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
VOC - Volatile Organic Compound.
(1) The potential carcinogenic risk and noncarcinogenic hazard quotients are calculated per exposure area by multiplying the soil or air EPCs associated with each EA by the unit risks and hazard quotients calculated in the Tables G-1-1. CTE and G-2a-1. CTE based on a unit soil or air concentration.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
NA - Not applicable; no dose-response value.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.
SVOC - Semivolatile Organic Compound.
TCDD-TEQ - 2,3,7,8-TCDD Toxicity Equivalence.
(1) Due to the multiple soil areas, a unit soil concentration of 1 mg/kg and a unit air concentration of 1 mg/m3 is used to calculate a potential excess lifetime cancer risk (ELCR) and noncancer hazard quotient (HQ) based on a unit soil concentration. Potential ELCRs and HQs calculated based on a unit concentration will be adjusted based on the area-specific EPCs in a scaling table.
(2) Totals not provided here; potential risks and hazards are based on the unit concentration. Totals are provided in the scaling table.

Table H-2-7. CTE
Summary of Receptor Risks and Hazards for COPCs - Adult Angler (Mixed Fish Diet) - Regional Areas
Central Tendency Exposure
Benning Road Facility RI/FS Project
3400 Benning Rd, N.E., Washington DC 20019

Scenario Timeframe: Current/Future
Receptor Population: Angler
Receptor Age: Teen

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk			Non-Carcinogenic Hazard Quotient			
				Ingestion	Dermal	Exposure Routes Total	Primary Target Organ(s)	Ingestion	Dermal	Exposure Routes Total

Notes
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(2) Total Risk/Hazard based on all COPCs except PCB-TEQ.
(3) Total Risk/Hazard based on all COPCs except Total PCBs.

Target Organ HI - Upper Potomac Fish

Organ	Chemical	Fish Tissue	Total
Bladder	Arsenic, organic	3.36E-04	3E-04
Developmental	PCB-TEQ, TCDD-TEQ, 4,4-DDE	3.47E-01	3E-01
Endocrine	Mirex	1.86E-05	2E-05
Eye	Total PCBs	5.02E-01	5E-01
Immune	Total PCBs	5.02E-01	5E-01
Liver	Pesticides	1.95E-02	2E-02
Nails	Total PCBs	5.02E-01	5E-01

Receptor Age: Child

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk			Non-Carcinogenic Hazard Quotient			
				Ingestion	Dermal	Exposure Routes Total	Primary Target Organ(s)	Ingestion	Dermal	Exposure Routes Total

Notes
NA - Not applicable.
PCB - Polychlorinated Biphenyl.
PCB-TEQ - PCB Toxicity Equivalence.
RfD - Oral Reference Dose.

(1) Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC.
(2) Total Receptor Risk/Hazard based on all COPCs except PCB-TEQ.
(3) Total Receptor Risk/Hazard based on all COPCs except Total PCBs.

Target Organ HI - Upper Potomac Fish

Organ	Chemical	Fish Tissue	Total

Notes:
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
PCB - Polychlorinated Biphenyl.
RfD - Oral Reference Dose.

(1) Baseline diet. Assumes a mixed fish diet of the species with available fillet data based on a pooled EPC. See Table 3-8.
(2) Based on maximum concentration for this species.
(3) Based on the average of the maximum values for catfish and largemouth bass.
